

DATA MANAGEMENT PLAN

XYZ-101 Phase 3 Clinical Study

Study ID: XYZ-101-301

Study Phase: Phase 3

Study Type: Randomized, Double-Blind, Parallel-Group, Placebo-Controlled

Planned Sample Size: 120 Subjects

Study Duration per Subject: Approximately 126 Days

Document Version: 1.0

Document Status: Training Use Only – Simulated Study

Prepared By: Clinical Data Management

Date: 31-Aug-2026

1. PURPOSE AND SCOPE

The purpose of this Data Management Plan (DMP) is to describe the procedures used for the collection, processing, review, cleaning, and management of clinical trial data for the simulated XYZ-101 Phase 3 study.

The DMP covers data management activities from study initiation through database lock and archiving.

This document is intended for training and portfolio demonstration purposes and does not represent an actual clinical trial.

2. STUDY OVERVIEW

XYZ-101-301 is a simulated Phase 3, randomized, double-blind, parallel-group, placebo-controlled clinical study in subjects with Type 2 Diabetes Mellitus.

A total of 120 subjects are planned.

Subjects will be assigned to either:

- XYZ-101 treatment group
- Placebo group

The primary endpoint is the change in HbA1c from baseline to the protocol-specified post-baseline assessment.

Secondary endpoints include:

- Change in fasting blood glucose

- Change in body weight
- Proportion of subjects achieving HbA1c <7.0% at Day 112
- Safety and tolerability

3. DATA MANAGEMENT RESPONSIBILITIES

Clinical Data Management will be responsible for:

- Reviewing the protocol from a data management perspective
- Identifying data requirements
- Developing and maintaining the DMP
- Supporting eCRF and database design
- Developing/reviewing edit checks
- Performing data review and cleaning
- Managing queries
- Supporting medical coding
- Performing or overseeing data reconciliation
- Preparing the database for freeze and lock

Other study functions, including clinical operations, biostatistics, medical/safety, and programming, will support data management activities according to their responsibilities.

4. DATA COLLECTION AND eCRF MANAGEMENT

Clinical data will primarily be collected through electronic Case Report Forms (eCRFs) within an Electronic Data Capture (EDC) system.

The eCRF will be designed based on:

- Study protocol
- Data Requirements Matrix
- Applicable data standards
- Study-specific data collection requirements

Planned eCRF areas include:

- Subject Identification
- Demographics
- Informed Consent
- Eligibility

- Medical History
- Concomitant Medications
- Randomization/treatment
- Vital Signs
- Laboratory Assessments
- Efficacy Assessments
- Adverse Events
- Treatment Exposure
- Study Completion/Discontinuation

Only required and scientifically justified data will be collected.

5. DATABASE AND EDIT CHECK MANAGEMENT

The clinical database will be designed according to approved eCRF and database specifications.

The database will include:

- Data fields
- Field types
- Units
- Controlled response options
- Required/conditional fields
- Visit structure
- Edit checks

Edit checks will be developed to identify potential:

- Out-of-range values
- Missing required data
- Invalid dates
- Inconsistent dates
- Cross-field inconsistencies
- Cross-visit inconsistencies
- Eligibility discrepancies

6. QUERY MANAGEMENT AND DATA REVIEW

Data discrepancies identified through automated edit checks, manual review, or other data review activities will be managed through queries.

The general query process will be:

Identify discrepancy → Raise query → Site response → CDM review → Resolve/close query

Queries will be tracked using a Query Management Log.

Data review will include:

- Missing data
- Inconsistent data
- Outliers
- Eligibility discrepancies
- Cross-form inconsistencies
- Cross-visit inconsistencies
- Treatment-related discrepancies
- Safety-related discrepancies

7. MEDICAL CODING AND RECONCILIATION

Applicable clinical data will be coded using appropriate standardized terminology.

Coding may include:

- Adverse events
- Medical history
- Concomitant medications

Where applicable, external data will be reconciled with corresponding EDC data.

Reconciliation activities may include:

- External laboratory data
- Safety/SAE data
- Treatment-related data

Any identified discrepancies will be investigated, documented, and resolved where applicable.

8. DATA PRIVACY AND QUALITY

Participant confidentiality and data integrity will be maintained throughout the study.

Access to the EDC will be controlled according to user roles and responsibilities.

Data management activities will include appropriate quality control measures such as:

- Review of data management specifications
- Review of edit checks
- Data review
- Query review
- Reconciliation review
- Database lock readiness review

For this simulated project, only synthetic subject data will be used. No real patient information or confidential sponsor data will be included.

9. DATABASE FREEZE AND LOCK

Before database lock, CDM will confirm that applicable data management activities have been completed.

The database lock readiness review will include:

- Required data entered
- Critical queries resolved
- Data discrepancies reviewed
- Coding completed
- External data reconciled where applicable
- SAE reconciliation completed where applicable
- Data cleaning completed
- Outstanding issues documented
- Database Lock Checklist completed

Following completion of the required activities, the database will be locked according to the defined procedure.

10. DOCUMENTATION AND ARCHIVING

Data management activities and decisions will be documented and maintained throughout the study.

Key documents will include:

- Protocol
- Data Requirements Matrix
- Data Management Plan
- eCRF Specifications
- Annotated eCRF
- Database Specifications
- Edit Check Specifications
- UAT Scripts and Results
- Query Log
- Reconciliation Log
- Data Cleaning Log
- Database Lock Checklist

Final study data and relevant data management documentation will be archived according to the defined study requirements.

11. DATA MANAGEMENT WORKFLOW

The overall data management workflow for the simulated study is:
